

Test Scenario: Two-Factor Authentication for Instagram Login on Unrecognized Devices.

Test Case Description:

Evaluate Instagram's Two-Factor Authentication mechanism while attempting to log in from unsaved devices to ensure the system functions properly.

Steps during the Test:

1. Attempt to access Instagram from an unrecognized device.
2. Enable Two-Factor Authentication for the account if not already enabled.
3. Make sure to enter an appropriate password and username.
4. Hold off until the registered device receives the authentication code.
5. Get the authentication code and input it while logging in.
6. Confirm that the system grants access upon successful entry of the authentication code.
7. Verify that unsuccessful entry of the authentication code results in denied access.
8. Verify to find out if login attempts from unsaved devices frequently cause the Two-Factor Authentication to be activated.
9. Verify that access cannot be granted by the system without the relevant authentication code.
10. Validate that the Two-Factor Authentication process works reliably for Instagram logins on unsaved devices.
